Electrical Designer (Updated 2022)

A modularized simulation-based circuit design solution that can be used to design a variety of electrical systems, including LED lighting, cooling systems, power distribution, automation, controls, and more. **System Analysis** The system analysis area of the Electrical Designer allows you to perform a number of different analyses based on a number of different criteria, such as power supply capacity, ground connection, device efficiency, radiation, radiation field, and more. Once a system analysis is complete, you will have a number of system analysis results. In the system analysis results, each analysis result can be enhanced for a single result in a number of ways, including color highlighting, graph visualization, and more. A well-designed electrical system makes all of the different areas of the electrical system work together to maximize the overall utility and performance of the electrical system. **Highlights: Integrated System Design** Electrical Designer is an all-in-one integrated circuit design solution, specifically focused on electrical systems. This tool allows you to design and simulate various electrical systems, including lighting systems, LED lighting systems, power systems, power distribution, automation systems, cooling systems, and more. What makes Electrical Designer different from other circuit design tools is that it provides not only a graphical system design environment, but also system analysis capabilities to help you perform the analysis required to design a well-performing electrical system. **What can you do with Electrical Designer?** You can create or import an electrical system design, analyze the performance of the electrical system based on different criteria, analyze the performance of electrical components based on different criteria, simulate how the electrical system will perform over time, visualize the electrical system graphically, export your designs in a variety of different file types, and more. **System Analysis** You can perform a variety of different analyses based on different criteria, such as ground or neutral connection, radiation, radiation field, device efficiency, power supply capacity, more. In the system analysis results, each analysis result can be enhanced for a single result in a number of ways, including color highlighting, graph visualization, and more. **Highlights: System Design Environment** The system design environment can be used to perform a number of different system analysis and design activities based on a number of different criteria, including radiated emissions, radiation field, and more.
