Earthquakes ceased along the EEOZ in July 2010, but the BGS stayed and became more active in 2010 and 2011 with well over 100,000 earthquakes since 2009. The BGS runs from the Drift Creek (Northeast Colorado), Drift Creek (Northwest Nebraska), and Connors (Midwest Nebraska)-Humbug faults, to the Red River, Copper-Bear, Red, and Platte Rivers, into the Oil Creek fault in the Oil Creek (Southwest Montana) Basin. The EEOZ is the largest (about 20 km across) of the top two ruptures in the central US; together, these zones have been causing considerable damage to basements, under-drains, and hollow structural members in rural towns (and some urban areas) throughout the Midwest region. Because it is part of the EEOZ, the BGS also adds to the overall wear on the EEOZ ruptures and can further damage existing EEOZ ruptures. It is possible, however, that the BGS-caused events might provide a clue to faults that do not form directly part of the Edge of the Earth. The BGS will continue to be an important and interesting research project and an area of interest during the next century. If you're a casual fan of weird and awesome geology, you may recognize basic structural topics in all these fault zones. Pop quiz: Look at all the fault zones leading into or connecting to the BGS. Look at the individual faults involved in each of these fault chains. Choose your main fault zone with the most earthquakes. What do you think of when you see the red highlighted area above? You'd think of the San Andreas Fault or perhaps the Epirus/Rhodope Complex in Macedonia or Greece. But the Oil Creek Basin has a well-known suite of faults, including Oil Creek itself (N

of the relationship between body mass index (BMI) and mental health. Body mass index (BMI) is a frequently used measure of nutritional status and it has been postulated that an elevated BMI may be associated with poor mental health. Many reviews have focused on the relationship between weight and mental health, but none have systematically examined this association. A systematic review of the literature was performed. The primary aim was to assess whether a relationship exists between BMI and measures of depression and anxiety, as well as whether there is a consistent relationship between other measures of nutritional status (e.g. fat mass, lean mass, blood glucose) and measures of mental health. A secondary aim was to explore the literature to assess possible mechanisms or mediating factors. An electronic literature search was conducted across 11 bibliographic databases including PubMed, Scopus, the Cochrane Collaboration Database of Systematic Reviews, CINAHL, Embase, Global Health, Sport Discus and Web of Science, by combining BMI and mental health into the search terms. Terms were searched using Boolean operator for inclusion and exclusion criteria. Manual searches were also conducted. Included were studies that were published in peer reviewed journals, included an adult population, measured the effects of BMI on mental health (self-reported measures of anxiety, depression, stress, or psychological distress), and had a longitudinal design. Observational studies, and those that assessed effect sizes only were excluded. The searches resulted in 910 articles, of which 68 were included for full review. Several studies have reported a significant positive association between BMI and mental health but these did not provide a consistent pattern. No consistent associations were found between other measures of nutritional status, BMI and mental health. Limited evidence exists to suggest that an elevated BMI is associated with elevated psychological distress. Preliminary evidence suggests that being underweight may be

associated with higher levels of depression, but further evidence is needed.[Transcranial Doppler ultrasonography in the diagnosis of Moyamoya angiopathy]. The information on the diagnostic value of transcranial Doppler ultrasonography (TCD) in the diagnosis of Moyamoya angiopathy (MMA) and arteriovenous fistulas (AVF) in Japan is limited.
