Leave a Reply Cancel reply.Q: compute the integral by simply substituting x into the term x ? I'm trying to compute the integral, $\int \frac{6x}{x^2+x+1} dx$ I know the solution is, $\int \frac{6x}{x^2+x+1} dx = \frac{1}{2} \int \frac{6}{x+\frac{1}{x}-1} dx$ from $u=x+\frac{1}{x}-1$ the solution also says the first term will be less than infinity my question is why the first term is less than infinity? A: The first term $6x/x^2$ is the integral of a positive function from 0 to $+\infty$, and by comparison with the upper limits, you see it is a divergent integral. Numerous factors act in concert to cause the progress of a cell from one point to another. For example, this progression can take place by regression of an existing tissue, formation of a mass, initiation of cell division, and/or the like. If such a change is undesirable, cells can be imaged to identify tissues, cells or structures that may have regressed or overdeveloped. Other applications of cellular imaging include the identification and characterization of disease processes, such as infections, congenital disorders, cancer, and the like, as well as identification of disease markers or the effects of drug interventions. The detection of cells is typically carried out by removing the cells from a living body, depositing the cells on a suitable substrate, and then subjecting the cells to imaging techniques. If a particular cell type is to be identified, a surface-labeling method can be used to identify the cells. For example, biotin or other biotinyl
